Ę,

Porphyromonas gingivalis genes and proteins - used in the detection and vaccination against periodontal disease.

Claim 5; Page 47-51; 153pp; English.

A portion (AAR96025) of P. gingivalis 381 haemagglutinin hagA (see also AAR96030) was identified as the product of clone ST2 (AAT30649) isolated from a P. gingivalis 318 genomic library. The haemagglutinin can be obtd. from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

```
This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the hagA haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease
Porphyromonas gingivalis genes - encoding haemagglutinin and/or poly:peptide(s)).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TLPNGWTMIDADGDGHNWLSTINVYNTATHTGDGAMFSKSWTASGGAKIDLSPDNYLVTP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                480
                                                                                                                                                                                                                                                    D. gingivalis 381 haemagglutinin hagA (AAR96030) was identified as the product of the hagA gene (AAT30654) isolated as an EcoRV fragment of genomic DNA. The haemagglutinin, or portions of it (see also AAR96021-24), can be obtd. from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

This sequence represents the hagA haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease

```

New antigenic protein complex from Porphyromonas gingivalis - comprising Arg- and Lys- specific thiol endo-peptidase(s), used in the detection, prevention and treatment of periodontal disease.

comprises a 300 kDa complexed a 45 kDa arginine specific thiol protease and 44, 15, 17 and 27 kDa adhesins encoded by the prtR gene (AATYB850), and a 148 kDa 19sine-specific thiol protease and 39, 15 and 4 kDa 19sine-specific thiol protease and 39, 15 and 4 kDa adhesins (see AAW4787) encoded by the prtK gene (AAY78851). A claimed antigenic complex comprises at least one adhesin domain, the complex of prtR and prtK each containing at least one adhesin domain, the complex of prtR and prtK each containing at least one adhesin domain, the complex baving a mol.wt. of over 200 kDa, and preferably comprises all 9 proteins of the PrtR-PrtK complex (see also AAW24780-85). It can be used in a claimed composition to elicit an immune response directed against of PG, and in a claimed method of reducing the prospect of PG infection and/or severity of disease. Antibodies directed against the complex are claimed for use in treating PG infection. Unlike whole PG cells or other PttK complex or component parts are safe and effective antigens. (Updated on 17-OCT-2003 to standardise OS field)

AG (AG-2) were isolated from P. gingivalis strains H66 (ATCC 33277) and W50 (ATCC 53373). The sequences of the proteins were used to design PCR primers and probes to isolate AG DNA. Lambda DASH and lambda ZAP libraries were screened with a probe based on amino acids 11-22 of the AG protein to obtain DNA encoding AG-1 (AAQ83484) and AG-2 (AAQ83489). AG-2 correct PN field.)

1326 YRDGTKIKEGLIETTFEEDGVATGNHEYCVEVKYTAGV9PKECVNVTI-NPTOFNPVKNL 1384 Arginine specific proteinase; Arg-gingipain; gingipain-2; haemagglutinin; immunogenic component; vaccine; inflammatory response; tissue damage; periodontal disease. 421 YRDNVVIAQNIAATIFNQENVAPGQYNYCVEVKYTAGVSPKVCKDVTVEGSNEFAHVQNL 480 This sequence represents a Porphyromonas gingivalis arginine-specific proteinase known as Arg-gingipain/gingipain-2 amino acid sequence. Gingipain-2 consists or a 50kD protease component non-covalently associated with a 44kD haemagglutinin component. The proteinase is stimulated by glycine containing peptides and glycine analogues. It is stimulated by cysteine protease group specific inhibitors. The protease preparation can be used in immunogenic compositions and vaccines against inflammatory response and tissue damage caused by P. gingivalis in periodontal disease. It can also be used to screen for agents that 720. .1185 /note= "Amino acids 720-1185 are specifically claimed" .206 KDVTGATKVKYYYAVNDGFPGDHYAVMISKTGTNAGDFTVVFEETPNGINKGGARFGLST -----AVSGEGSSNDYTYTV New Porphyromonas gingivalis arginine-specific protease preparation useful for preparing vaccines against periodontal disease and for screening for Arg-gingipain inhibitors. 229. .719 /note= "Amino acids 229-719 are specifically Arg-gingipain-2 amino acid sequence. AAU08938 standard; protein; 1704 AA.

```
The invention relates to a recombinant DNA molecule encoding high molecular weight (mature) Arg-gingipain (AG) protein, which has an enzymatically active protease component (AG-2) and a haemagglutinin component, from P. gingivalis. The nucleic acid is useful for producing mature Arg-gingipain protein. Immunogenic compositions comprising Arg-gingipain are useful for immunising animals including humans against inflammatory response and tissue damage caused by an archaebacterium Porphyromonas gingivalis, which causes progressive periodontitis. Arg-gingipain is also useful for identifying agents that modulate Arg-gingipain is also useful for identifying agents that modulate Arg-gingipain proteinase activity, whether by acting on the protein in the preventing the interaction of the proteinase with the protein in the gingival area, such as complement factors C3 or C5. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant DNA molecule which encodes high molecular weight (mature) May-gingipain protein, useful for immunization against inflammation and tissue damage, comprises enzymatically active protease component and hemaglutinin component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DVWEDGTGYQMLWDADHNQYGASIPEE--SFWFANGTIPAGLYDPFEYKVPVNADASFSP 126

The haemagglutinin can be obtd. from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The haemagglutinin can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             193
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the hagE haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as vaccines against periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   68

                                                                                                                                                                                                                                   67
derived from P. gingivalis 318 genomic DNA. A first open reading frame coded for hagD protease (see also AAR96031). The protease and haemagglutinin can be obtd. from transformed host cells and used in vaccines to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of live vaccines. The haemagglutinin and protease can also be used to detect the presence of anti-P. gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is encoded by a Porphyromonas gingivalis gene of the invention. This sequence represents the hagD haemagglutinin protein. The polypeptides are used to produce antibodies to organisms associated with periodontal disease. The antibodies are also used in purification and identification procedures. The genes and polypeptides are used as

    encoding haemagglutinin and/or

| NPI; 1996-287181/29.  N-PSDB; AAT30653.  XX  PT  Porphyromenas gingivalis genes and proteins - used in the detection and vaccination against periodontal disease.  XX  Claim 5; Page 76-81; 153pp; English.  XX  C gingivalis W12 cysteine protease, porphypain (AAR96029), was C dentified as the product of the prtp gene (AAT30653) isolated from P. C dentified as the product of the prtp gene (AAT30653) isolated from P. C gingivalis W12 genemic DNA. The porphypain shows homology to the haemagglutinins (see also AAR96026-28 and AAR96030-33) of P. gingivalis C G 318. It can be obtd. from transformed host cells and used as a vaccine to protect humans or animals against periodontal disease. Expression in Salmonella cells allows prodn. of a live vaccine. The porphypain and C c haemagglutinins can also be used to detect the presence of anti-P. C gingivalis antibodies and to raise monoclonal antibodies for diagnostic appln. A PITR-PITK cell surface protein of Porphyromonas ginivalis (PG) comprises a 300 kDa complex composed a 48 kDa lysine-specific thiol protease and 39, 15 and 44 kDa adhesins encoded by the pirk gene (AAT78851), and a 45 kDa arginine-specific thiol protease and 44, 15, 17 and 27 kDa adhesins (see AAW24786) encoded by the pirk gene (AAT78850). A claimed antigenic complex comprises at least one multimeric protein complex of Pirk and Pitk each containing at least one adhesin domain, the complex having a mol.wt. of over 200 kDa, and preferably comprises all 9 proteins of the Pitk complex (see also AAW24780-85). It can be used
                                                                                                                                                                                     dontal disease; cell surface protein; thiol protease; endopeptidase;

in a claimed composition to elicit an immune response directed against by, and in a claimed method of reducing the prospect of RG infection and/or severity of disease. Antibodies directed against the complex are claimed for use in treating PG infection. Unlike whole PG cells or other perviously prepared antigens based on fimbriae or the capsule, the PtR. PtK complex or component parts are affe and effective antigens. (Updated on 17-OCT-2003 to standardise OS field)

A. Molecule type: DNA
A. Residues: 1-635 < GOS
A. Residues: 1-635 < GOS
A. Residues: 1-635 < GOS
A. Cose-references: EMBL:X57094; NID:948815; PIDN:CAA40378.1; PID:948816
A. Molec: the authors translated the codon GAA for residue 78 as Gly, CCT for residue 272
C. Function:
A. Description: catalyzes the hydrolysis of 1,4-beta-xylosidic linkages in xylans
A. Description: catalyzes the hydrolysis of 1,4-beta-xylosidic linkages in xylans
C. Superfamily: Clostridium xylanase A repeat homology
C. Keywords: glycosidase; hydrolase; polysaccharide degradation
F;408-502/Domain: Clostridium xylanase A repeat homology < CXA>

PLAYS AN IMPORTANT ROLE IN SOFT TISSUE INFECTIONS AND IS A VIRULENCE FACTOR.

-!- SUBCELLULAR LOCATION: In membrane vesicles.
-!- SIMILARITY: Belongs to peptidase family C25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    199 GNEFAPVQNLQWSVSGQTVTLTWQAPASDKRTYVLNESFDTQT---LPNGWTMIDADGDG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             68
                                                                                                                                            CATALYTIC ACTIVITY: Cleavage of proteins, including collagens and immunoglobulins, with a preference for Arg in Pl, and hydrophobic residues in P2 and P3.

ENZYME REGULATION: Requires cysteine for activation and Ca(2+) and/or Mg(2+) for stabilization. It is stimulated by glycine-containing dipeptides. It is resistant to inhibition by proteinase inhibitors in human plasma.

SIMILARITY: Belongs to peptidase family C25.
                                                    intracellular degradation and turnover of proteins. Its proteolytic activity is a major factor in both periodontal tissue destruction and in bacterial host defense mechanisms. Activates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TAAAQG------GPKTAPSVTHQAVQK--GIR---TSKVKDLRDPIPAGMARIILEAH
